

# PERFORMANCE DATA

## Alfalfa & Potato

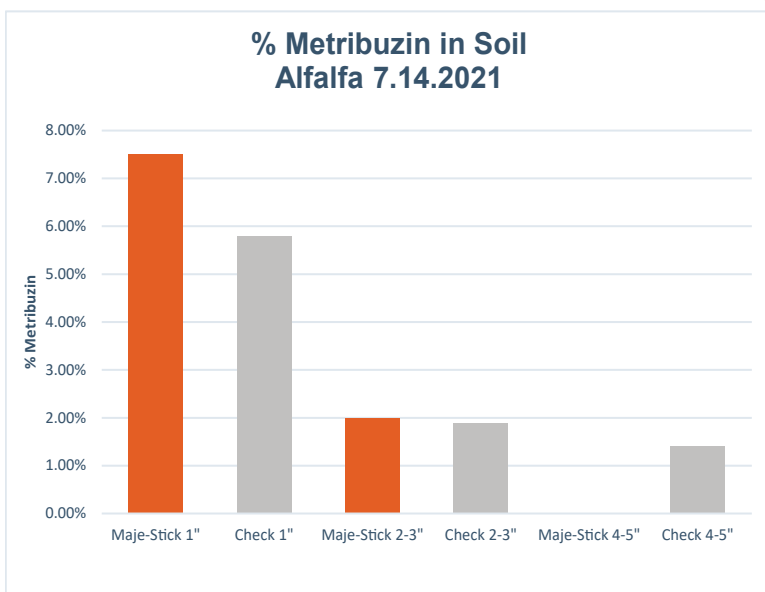

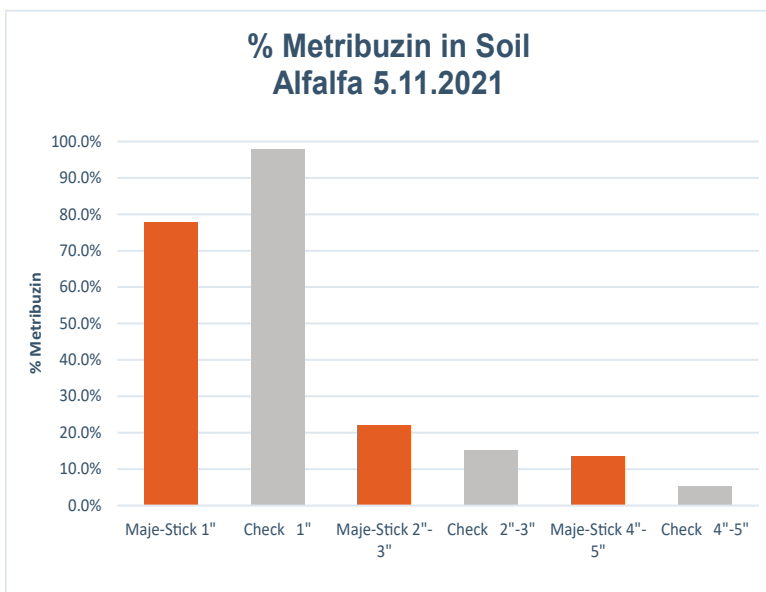

# Maje-Stick

Soil Moisture  
Retention Agent

### Trial Data Overview

Trials in 2021 showed Metribuzin applied with Maje-Stick, retained more herbicide in the top 3 inches of soils, the weed germination root zone than without Maje-Stick.

This allows active herbicide to be retained longer for improved weed control without risk to crops.

### Effect of Maje-Stick on Herbicide Performance Potato

Potato trials in 2022 tested multiple herbicides with Maje-Stick. The herbicide combinations did not cause phytotoxicity, affect germination, plant vigor, or affect yield or quality grade.
